

Secondary School Child Health Profile

Kettering September 2018

Kettering is similar to the national England on the majority of the child health indicators included in this profile.

Kettering is significantly better than the national average on the following indicators:

- Proportion of under 16s in low income families
- Proportion of full term babies with low birth weight
- Admissions to hospital for unintentional and deliberate injuries (aged 0 to 14 years)
- Chlamydia detection rate (above target)

Kettering is significantly worse than the national average on the following indicators:

- Proportion of children achieving 5+ GCSEs at grades A*-C
- Proportion of pregnant women smoking at time of delivery
- Proportion of overweight or obese children in Reception
- Admissions to hospital for unintentional and deliberate injuries (aged 15 to 24 years)
- Admissions to hospital for intentional self-harm
